## Food forming

### Features

- Accurate variable portion control
- ~
- Fully automatic
- ~
- Automatic paper attachment
- ~
- Multiple form shapes available
- ~
- Quick product change
- ~
- Full CE Conformity
- ~
- International electrical specifications
- ~
- Suited to a variety of mixes
- ~
- Handles large particulates without damage

The Formatic range, by JM Poultry Technology BV, guarantees accurate portioning and forming of a wide variety of mixtures and products. Encompassing Retail and Industrial sized models, the range has been developed to accommodate the needs of low and high volume producers of bakery, meat, snack foods and ready meal products. Not only has the Formatic shown efficiency gains of over 40% in low volume production plants, it has also proved to be perfect for in-house product development facilities.

#### Retail Formatic

The **Formatic R1200** is the smallest model in the Formatic range. With an output capacity of 1200 forms per hour, the R1200 is ideal for the lower volume or specialist producer. Large-scale producers requiring test kitchen machinery will also find the R1200, with its low commitment capacity and optimal forming ability, perfect for the development of new products.

#### Commercial Formatic

The Commercial Formatic achieves larger form shapes than the R1200, and is available in two higher capacity models. The **Formatic C2000** is a three phase model ideally suited to fixed speed applications, whilst the single phase **C4000** model, with variable speed control, offers increased production flexibility and higher output capacity.

#### Industrial Formatic

With variable speed control of up to 4000 forms per hour, the **Formatic I4000** is able to achieve a form shape of up to 150-mm diameter, to a depth of 50 mm. Whilst the I4000 is ideally suited to producing larger form shapes, it also offers producers the flexibility to increase production output by increasing the number of products formed per revolution.

#### Traymatic

The Traymatic combines accurate food portioning and forming with an innovative product traying system. Product handling is cut to a minimum, as the Traymatic presents full trays of product ready for the oven or storage.

### **Formatic Indexing**

The Formatic X2500 combines accurate portion control with the automated placing of product directly into foils or containers. This indexing model has an output capacity of up to 2500 forms per hour, and is ideal for placing products such as garlic butter into trays, cheese sauce onto fish portions, flapjack into foils and Christmas pudding into dishes.

### **Formatic Stacking**

The **Formatic S2500** enables the food producer to automatically stack formed product. With the facility to fully paper interleave every product, the Formatic S2500 prepares product for freezing, packaging or consumer display.

### **Formatic Drums**

The Formatic drum provides the food processor with the flexibility to produce multiple lines quickly and easily. In house manufacturing skills enable Deighton Manufacturing Limited to tailor every drum to our customers' unique design requirements, and with the ability to produce virtually any two dimensional shape, the product possibilities offered by the Formatic are endless!
